

FLIP SIGN AS-4

Flip-sign AS - 4 is a pneumatically controlled warning sign for installation in forward direction on vehicles for road work. AS - 4 flips between transport position (yellow) and working position (red-yellow). The flip-sign is controlled between these two positions from the driver's cabin with a simple button switch change. This feature increases safety and saves time. The signs have a robust design and are made of stainless steel/aluminum and all parts are changeable. The signs are pneumatically operated and only use a small amount of air.
